- Initiates seed germination process
- Stimulates root growth and development
- Facilitates germination at low temperatures
- Accelerates emergence of uniform seedlings
- Alleviates herbicidal stress
- Improves phosphorus uptake at low temperatures
- Stimulates root system growth and development
- Increases tolerance to day/night temperature fluctuations
- Corrects nutrient deficiencies
- Exhibits synergy with fungicides
- Enhances drought resistance
- Increases photosynthetic activity
- Improves drought tolerance
- Stimulates root crop development
- Corrects nutrient deficiencies
- Enhances immune resistance
- Demonstrates tolerance to high temperatures
- Stimulates filling of root crops
- Improves drought tolerance
- Increases quantitative and qualitative crop yields

Table of Application of Life Biochem Products by Crop Development Stages

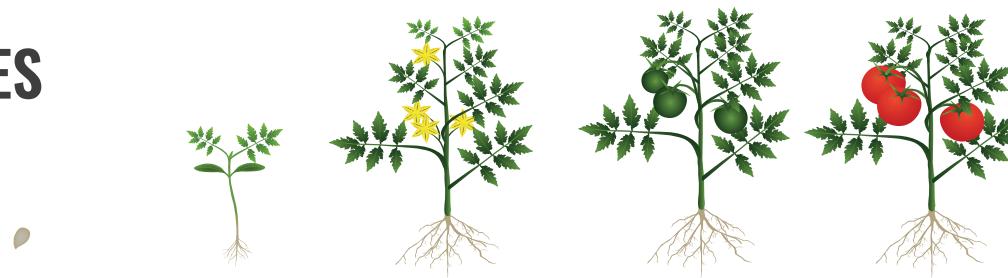

# POTATOES

- Increases frost resistance
- Stimulates growth at low temperatures
- Enhances tolerance to temperature fluctuations
- Regulates water exchange
- Increases photosynthetic activity
- Stimulates pollen viability
- Increases frost resistance
- Corrects nutrient deficiency
- Exhibits synergistic effect with fungicides
- Improves resistance to high temperatures
- Enhances drought resistance
- Promotes cluster filling
- Stimulates photosynthetic activity
- Improves nutrient transport
- Increases berry size
- Improves drought resistance
- Enhances plastic material outflow
- Increases sweetness
- Promotes berry filling
- Improves transportability
